HANDSMEN THREADS: ELEVATING THE ART OF SOPHISTICATION IN MEN'S FASHION

User Story

HandsMen Threads is a men's fashion business that aims to provide customers with a smooth and personalized shopping experience while efficiently managing its business operations. Customers want to explore men's fashion products, check product availability, place orders, receive order confirmations, and stay informed about their purchases. Sales staff need a centralized system to maintain customer information, manage orders, and access customer purchase history so that they can provide better service. Inventory managers need accurate and updated information about product stock levels to avoid shortages and ensure timely restocking. Marketing staff require customer information and purchase history to create effective marketing campaigns and improve customer engagement. Administrators and managers need a centralized view of customers, products, orders, inventory, and marketing activities through reports and dashboards. Salesforce is used to bring these activities together in a single platform and automate important business processes.

1. INTRODUCTION

1.1 Project Overview:

HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion is a Salesforce-based fashion retail management project designed to improve the management of customers, products, orders, inventory, marketing activities, and customer relationships. In a traditional fashion retail environment, important information may be maintained using spreadsheets, manual records, or separate systems. This can result in duplicate data, inaccurate inventory information, delayed order processing, and difficulty in understanding customer preferences. The proposed Salesforce solution provides a centralized platform where business information can be stored, accessed, and managed efficiently.

The system uses Salesforce capabilities such as custom objects, custom fields, relationships, validation rules, Lightning applications, record-triggered flows, scheduled flows, email alerts, Apex, reports, dashboards, profiles, roles, permission sets, and sharing rules. These features help automate repetitive activities, improve data accuracy, provide timely notifications, and support management in making better business decisions.

1.2 Purpose:

The main purpose of the HandsMen Threads project is to improve the efficiency and accuracy of men's fashion retail management using Salesforce.

- The system aims to:
- Reduce manual data-entry and order-processing errors.
- Maintain organized customer and product information.
- Improve inventory visibility.
- Identify low-stock products.
- Automate important order-processing activities.
- Automate order confirmation and customer notifications.
- Improve customer-service response and engagement.
- Manage customer loyalty activities efficiently.
- Provide controlled access to business information.
- Support management through reports and dashboards.
- Provide a scalable foundation for future enhancements.

2. IDEATION PHASE

The ideation phase focuses on identifying the major challenges faced by HandsMen Threads in managing customers, products, orders, inventory, and sales activities. Different ideas were explored to develop a centralized Salesforce-based solution that could reduce manual work and improve business efficiency.

Key Ideas Identified

• **Centralized Customer Management:** Maintain customer information and order history in one platform.

• **Order Management:** Manage customer orders, order status, quantities, payments, and delivery details efficiently.

• **Inventory Management:** Track product stock and automatically identify low-stock products.

• **Automated Notifications:** Send order confirmation, payment, delivery, and stock alert emails automatically.

• **Data Validation:** Use validation rules to prevent incorrect product, order, and inventory data.

• **Role-Based Security:** Control access to customer, product, order, and inventory information based on user responsibilities.

2.1 Problem statement

PS (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1 – Customer	Find suitable men's fashion products and place orders easily	Product, order, and availability information may not be easily accessible	Customer and product information is not managed through a centralized system	Frustrated and uncertain
PS-2 – Sales Staff	Process customer orders efficiently	Order details may be handled manually and may contain errors	Order processing activities are not fully centralized or automated	Frustrated and error-prone
PS-3 – Inventory Manager	Track product stock accurately	I don't have real-time visibility of available inventory	Inventory information is difficult to monitor across different processes	Concerned about stockouts and overstock
PS-4 – Marketing Staff	Engage customers through suitable marketing campaigns	Customer preferences and purchase information are difficult to access	Customer data is not centralized for effective marketing activities	Challenged and less effective
PS-5 Manager	Monitor orders and overall business performance	I don't get timely and accurate information about sales, orders, and inventory	Business data is not organized in a centralized system	Uncertain and unable to make quick decisions

PS-6 – Administrator	Manage business information securely	Different users require different levels of access	Business information needs controlled access based on user responsibilities	Concerned about data security

2.2 Empathy Map Canvas

User Persona: Sales Staff

- Think & Feel: Worried about processing customer orders incorrectly, missing important product or order updates, and handling increasing customer requests. Feels pressured to maintain accurate customer and order information while providing quick service.
- Hear: Questions from customers about product availability, prices, sizes, order status, and delivery information, along with questions from managers about pending orders, sales performance, and customer satisfaction.
- See: Multiple customer records, product information, inventory details, order records, and customer requests without a single centralized view of the complete customer and order status.
- Say & Do: Checks product availability repeatedly, follows up manually with customers and inventory staff, creates and updates customer and order records, monitors order status, and assists customers with their fashion product requirements.

Pain Points

- Difficulty in tracking customer orders and their current status.
- Repeated manual checking of product and stock availability.
- Risk of entering incorrect customer, product, or order information.
- Delays in communicating order updates to customers.
- Lack of centralized information for quick customer support.
- Manual follow-up with inventory and delivery teams.
- Difficulty in monitoring multiple orders simultaneously.

2.3 Brainstorming & Idea Prioritization

Step 1: Brainstormed Ideas

• **Spreadsheet-based fashion retail management:** Use shared spreadsheets to maintain customer, product, order, inventory, and marketing information more consistently.

• **Standalone fashion retail portal**: Build a custom web application where customers can browse men's fashion products, place orders, and track their order status online.

• **Retail management system:** Develop a centralized retail business system with customer, product, order, inventory, loyalty, and marketing management modules.

• **Salesforce-based fashion retail management system:** Build a unified cloud application using custom objects, Formula Fields, Validation Rules, Flows, Approval Processes, Apex Classes, Triggers, Reports, and Dashboards.

• **Automated order notifications:** Send notifications to customers, sales staff, inventory managers, and managers when orders are created, processed, delayed, or completed.

• **Real-time inventory monitoring:** Provide up-to-date views of product availability and identify low-stock products to help prevent stockouts.

• **Automated order processing:** Automatically create tasks, update order statuses, and perform required actions when an order is created or modified.

• **Customer loyalty management:** Maintain customer loyalty information and update loyalty points based on completed purchases to improve customer retention.

• **Marketing campaign management:** Use customer information and purchase history to create suitable marketing campaigns and improve customer engagement.

• **Management dashboards:** Provide managers with summarized views of customers, orders, inventory levels, sales, popular products, loyalty activities, and overall business performance.

Step 2: Grouping

Group	Ideas	Description
Manual solutions	Spreadsheet-based fashion retail management	A simple and low-cost approach for managing customer, product, order, and inventory information, but it requires manual data entry and may lead to errors.
Semi-automated solutions	Standalone fashion retail portal; Retail management system	These solutions can automate selected retail activities such as product and order management, but may require separate systems and additional customization.
Fully automated cloud solutions	HandsMen Threads Salesforce-based system; Automated order notifications; Real-time inventory dashboards; Customer loyalty management; Marketing campaign management	These solutions provide centralized cloud-based management, automation, real-time visibility, customer engagement, and scalable support for HandsMen Threads retail operations.

Step 3: Idea Prioritization

Each idea is rated High, Medium, or Low against the criteria below.

Idea	Impact	Feasibility	Cost Efficiency
Spreadsheet-based fashion retail management	Low	High	High Cost, Low Efficiency
Standalone fashion retail portal	Medium	Medium	Low Cost, Medium Efficiency
Retail management system	Medium	Medium	Medium Cost, Medium Efficiency
HandsMen Threads Salesforce-based system	High	High	High Cost, High Efficiency
Automated order notifications	High	High	High Cost, High Efficiency
Real-time inventory dashboards	High	Medium	High Cost, High Efficiency
Customer loyalty management	High	High	High Cost, High Efficiency
Marketing campaign management	High	High	High Cost, High Effiency

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

The journey map follows a customer and the HandsMen Threads staff through the fashion retail order management process, from product search and customer registration to order processing, inventory verification, customer support, and business performance review.

Stage 1: Product Search & Customer Registration

User Actions: Searches for required men's fashion products such as shirts, trousers, jackets, suits, footwear, or accessories and provides customer details.

Touchpoints: Product catalog, sales staff, customer service.

Pain Points: Manual customer registration, incomplete information, and duplicate customer records.

HandsMen Threads Solution: Customer records are maintained centrally, with validation rules used to prevent incomplete and duplicate information.

Emotion: Interested and hopeful.

Stage 2: Product Selection

• **User Actions:** Views available fashion products and checks product category, price, size, and available quantity before placing an order.

• **Touchpoints:** Product records, sales staff, inventory information.

• **Pain Points:** Unclear stock availability and outdated product information.

• **HandsMen Threads Solution:** Centralized Product and Inventory records provide updated information about product availability, price, and stock levels.

• **Emotion:** Interested but unsure.

Stage 3: Order Creation

User Actions: Selects the required fashion products and submits an order with the required quantity and customer information.

Touchpoints: Order form, sales staff, customer service.

Pain Points: Manual order entry, incorrect quantities, and processing errors.

HandsMen Threads Solution: Each purchase is recorded as an Order with validation rules that prevent invalid quantities and incomplete order information.

Emotion: Anxious.

Stage 4: Inventory Verification

User Actions: Waits while the availability of the ordered fashion products is checked.

Touchpoints: Inventory manager, product records, inventory records.

Pain Points: Difficulty identifying current stock levels and risk of stockouts.

HandsMen Threads Solution: Inventory information is maintained centrally, allowing staff to verify available quantities and identify low-stock products.

Emotion: Cautious.

Stage 5: Order Approval & Processing

User Actions: Waits while the order is reviewed and processed for further fulfillment.

Touchpoints: Sales staff, manager, approval process.

Pain Points: Processing delays and lack of visibility into order status.

HandsMen Threads Solution: An approval process routes applicable orders to the appropriate manager and provides status updates and notifications.

Emotion: Impatient and uncertain.

Stage 6: Order Fulfillment & Customer Notification

User Actions: Waits for the ordered fashion products to be processed and receives notifications about the order status.

Touchpoints: Order records, sales staff, customer service, notification system.

Pain Points: Manual order-status tracking and delayed customer notifications.

HandsMen Threads Solution: Order information is maintained centrally, while automation supports order-status updates and customer notifications.

Emotion: Relieved.

Stage 7: Reporting & Customer Support

User Actions: Receives the order and contacts customer support if assistance is required, while management reviews sales, customer, and inventory performance.

Touchpoints: Customer service, reports, dashboards.

Pain Points: Delayed information and difficulty analyzing sales, order, customer, and inventory performance.

HandsMen Threads Solution: Reports and Dashboards provide insights into order volume, order status, inventory levels, customer information, and overall business performance.

Emotion: Satisfied and confident.

3.2 Solution Requirements

Functional Requirements

FR-1: Customer Management

• **Description:** Manage customer records.

Details: Create, update, and view customer profiles with contact details, address, customer type, preferences, and order history. Validation rules prevent incomplete and duplicate customer records.

FR-2: Product & Inventory Management

Description: Create and manage fashion products and inventory.

Details: Maintain product name, category, price, size, available quantity, reorder level, and product status. Inventory information helps users monitor stock availability and identify low-stock products.

FR-3: Order Processing

Description: Create, process, approve, and update customer orders.

Details: Sales staff create orders containing customer and product information. Validation rules prevent invalid quantities and incomplete records, while automation updates order status and performs required follow-up activities.

FR-4: Order Approval

Description: Review and approve applicable customer orders.

Details: Orders requiring authorization are submitted through an Approval Process. Managers can approve or reject orders, while notifications keep relevant users informed about the order status.

FR-5: Customer Loyalty Management

Description: Manage customer loyalty and engagement activities.

Details: Customer loyalty information is maintained to support customer engagement and retention. Automation can update applicable loyalty information based on customer orders and related activities.

FR-6: Automated Order Management

Description: Automate repetitive order-processing activities.

Details: Automation creates tasks for new orders, updates relevant records, identifies low-stock conditions, and sends notifications to appropriate users.

FR-7: Reporting & Dashboards

Description: Provide reports and dashboards for business monitoring.

Details: Track order volume, order status, inventory levels, low-stock products, customer information, loyalty activities, and overall business performance through reports and dashboards.

Non-Functional Requirements

NFR-1: Security

• **Description:** Protect customer, order, inventory, and business data.

Details: Profiles, roles, permission sets, sharing rules, and field-level security provide users with access according to their responsibilities.

Acceptance Criteria:

- Users can access only the records and features permitted by their assigned roles and permissions.
- Restricted fields cannot be viewed or modified by unauthorized users.
- At least one security control is applied to each major user role.
- Unauthorized access attempts are prevented by Salesforce security settings.

NFR-2: Usability

Description: Provide a simple and organized user experience.

Details: Lightning App pages, page layouts, tabs, and record views should allow sales, inventory, marketing, and management users to access required information with minimal training.

Acceptance Criteria:

- Each user role can access its required objects and information from the Lightning App.
- Common business records can be accessed through the relevant tabs and navigation items.
- Required information is visible through appropriate page layouts and record views.
- A new user can perform the main assigned tasks with minimal guidance.

NFR-3: Performance

Description: Provide efficient processing of business operations.

Details: Customer records, orders, inventory information, automation, reports, and dashboards should operate efficiently during normal business activities.

Acceptance Criteria:

- Standard record operations complete without noticeable delay during normal usage.
- Automation executes successfully when its defined conditions are met.
- Reports and dashboards load successfully using the available business data.
- No unnecessary duplicate automation or repeated record updates occur.

NFR-4: Scalability

Description: Support growth in customers, products, orders, and inventory.

Details: The system should accommodate increasing business data and users without requiring major changes to the overall solution design.

Acceptance Criteria:

- New customer, product, inventory, and order records can be added without changing the basic system design.
- Additional authorized users can be added using existing security configurations.
- The system supports expansion of product categories and business records.
- Existing automation continues to function when new records are added.

NFR-5: Reliability and Availability

Description: Provide dependable access to order and inventory information.

Details: The cloud-based platform should provide reliable access to business records, automation, reports, and dashboards for authorized users.

Acceptance Criteria:

- Authorized users can access required records during normal system operation.
- Records created or updated successfully remain available after saving.
- Configured automation executes consistently when its conditions are satisfied.
- Reports and dashboards display available business information without data loss.

NFR-6: Data Accuracy

Description: Maintain consistent and accurate business data.

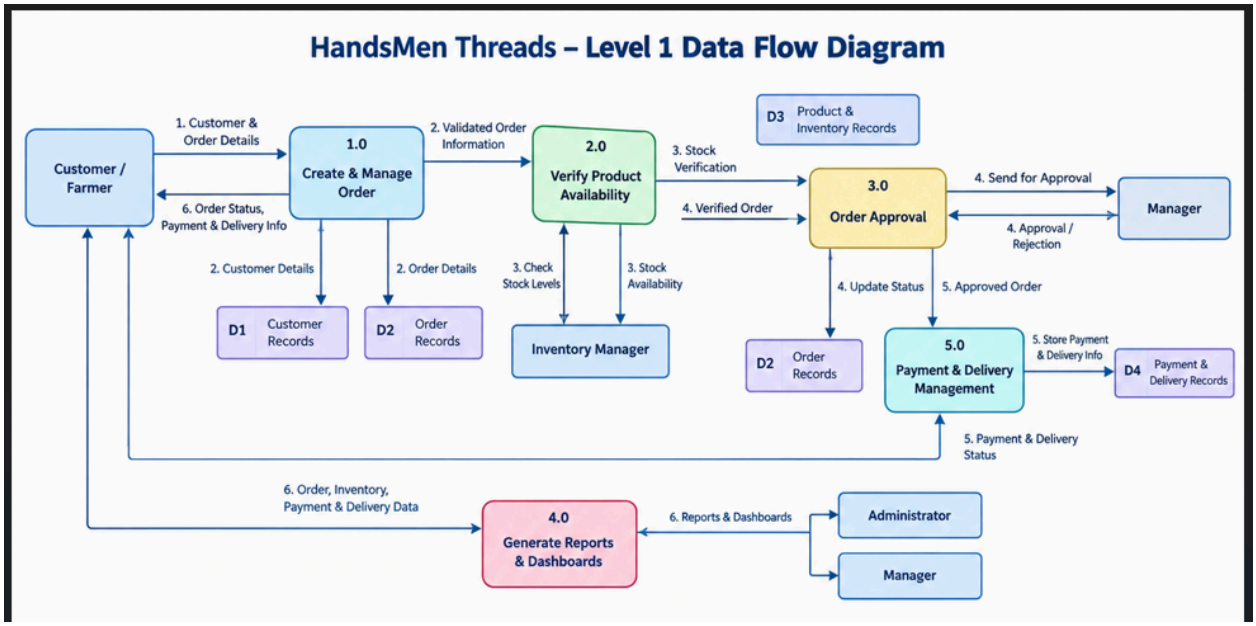

Details: Required fields, validation rules, formula fields, automation, and controlled data access reduce manual errors and improve the accuracy of customer, product, order, and inventory information.

Acceptance Criteria:

- Required fields prevent incomplete records from being saved.
- Validation rules prevent invalid business data from being entered.
- Formula fields calculate values consistently according to their defined formulas.
- Automated updates maintain consistency between related business records.
- Duplicate or inconsistent data is minimized through validation and controlled data entry.

3.3 Data Flow Diagram

This is the Level-1 data flow diagram for the main steps of the system.

Here is how the diagram maps to the steps:

• **Step 1, input:** The customer submits customer and order details into Process 1, **Create & Manage Order**.

• **Step 2, Validation and Storage:** Process 1 validates the order information and stores customer details in **D1 (Customer Records)** and order details in **D2 (Order Records)**. Process 2 verifies product availability using **D3 (Product & Inventory Records)**.

• **Step 3, Inventory Verification:** Process 2 checks the requested product quantity with the inventory manager and verifies whether sufficient stock is available. The verified order is then sent to Process 3.

• **Step 4, Approval Routing:** Process 3 sends applicable orders to the manager for approval and receives the approval or rejection decision. The order status is then updated in **D2 (Order Records)**.

• **Step 5, Payment and Delivery:** Process 5 handles the payment and delivery information for approved orders and stores the details in **D4 (Payment & Delivery Records)**. The payment and delivery status is communicated to the customer.

• **Step 6, Reports and Dashboards:** Process 4 reads the processed order, inventory, payment, and delivery information and provides reports and dashboards to the administrator and manager for monitoring and decision-making.

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

The HandsMen Threads Fashion Retail Management System directly addresses fragmented fashion retail order, customer, inventory, and business management workflows by aligning user requirements, business processes, and automation using centralized Salesforce capabilities.

Problem Statement
Men's fashion businesses often manage customer information, product details, orders, inventory, customer engagement, and marketing activities through separate spreadsheets, registers, and manual processes. This can cause duplicate records, incorrect order details, stockouts, delayed order updates, and limited visibility into business operations. Sales staff spend significant time on manual order processing, inventory managers have difficulty monitoring stock levels, marketing staff may lack centralized customer information for effective campaigns, managers lack timely information for decision-making, and customers may not receive accurate updates about their orders.

Problem sloving mapping

Problem (User Behavior / Constraint)	**HandsMen Threads Solution**	**Salesforce-Native Capability**
Customers may have difficulty finding suitable fashion products based on category, size, and availability	Maintain centralized product information with category, size, price, and availability details	Custom Objects, Fields and Lightning App
Customer details and fashion preferences may be recorded separately or manually	Maintain a centralized customer profile containing contact details, preferences, and order history	Custom Objects, Relationships and Validation Rules
Sales staff may enter incorrect product quantities or incomplete order details	Validate order information before saving and automate order-processing activities	Validation Rules, Required Fields and Flow
Inventory staff may not identify low-stock fashion products in time	Track available quantity and reorder level and automatically identify low-stock products	Formula Fields, Flow Automation and Reports

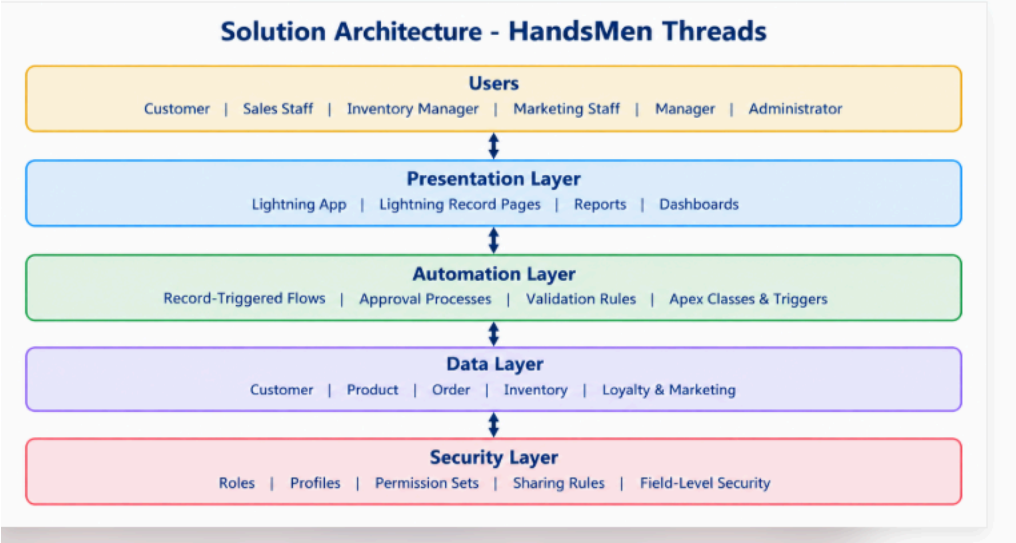

Customer loyalty activities may be difficult to manage consistently	Maintain customer loyalty information and update applicable loyalty details based on customer activities	Custom Fields, Flow Automation and Customer Records
Marketing staff may not have organized customer information for targeted campaigns	Use centralized customer and purchase information to support customer engagement and marketing activities	Reports, List Views and Automation
Managers may lack a clear view of sales, orders, inventory, and customer performance	Provide centralized dashboards for monitoring key retail performance indicators	Reports and Dashboards
Different users may require different levels of access to customer, order, product, and inventory information	Provide role-based access according to user responsibilities	Profiles, Roles, Permission Sets, Sharing Rules and Field-Level Security

4.2 Proposed Solution

Parameter	Description
Problem	Men's fashion retail operations may depend on spreadsheets, manual records, and disconnected processes for managing customers, products, orders, inventory, loyalty activities, and marketing, which can lead to incorrect order information, stock shortages, delayed processing, and difficulty tracking customer and business activities.
Solution	A Salesforce-based HandsMen Threads Fashion Retail Management System that manages customer records, fashion products, orders, inventory, customer loyalty, marketing activities, and business reporting through a centralized platform.
Novelty	Integration of automated order processing, inventory monitoring, low-stock identification, customer loyalty management, marketing support, validation, and notifications using Salesforce-native capabilities such as Flows, Validation Rules, Apex, Lightning, Reports, and Dashboards.
Social Impact	Improves the customer shopping experience through better product availability, faster order processing, accurate order information, improved customer engagement, and reduced manual administrative work for retail staff.
Revenue Model	Revenue is generated through men's fashion product sales, supported by improved customer retention, loyalty activities, and targeted marketing campaigns that encourage repeat purchases.
Scalability	Supports increasing numbers of customers, fashion products, orders, inventory records, and users. Additional product categories, customer engagement features, marketing activities, and business functions can be added without redesigning the complete system.

4.3 Solution Architecture

The architecture integrates Salesforce objects, automation flows, approval processes, Apex components, reports, dashboards, and security layers. Users interact with the HandsMen Threads Fashion Retail Management System through the Salesforce Lightning interface, while automation processes customer orders, inventory activities, order approvals, loyalty updates, and customer notifications. The resulting information is stored in related customer, product, order, inventory, and marketing/loyalty records, and the security layer controls access to customer, order, inventory, and business data based on user roles and permissions.

Here is how the layers work together:

How the layers work together

- **Users:** Customers, sales staff, inventory managers, marketing staff, managers, and administrators access the system according to their responsibilities.
- **Presentation Layer:** The Lightning App, record pages, reports, and dashboards provide an organized interface to manage fashion products, customers, orders, inventory, and business information.
- **Automation Layer:** Flows, approval processes, validation rules, and Apex components automate order processing, inventory checking, low-stock alerts, order approvals, loyalty updates, notifications, and status updates.
- **Data Layer:** Customer, Product, Order, Inventory, and Loyalty & Marketing records store the required HandsMen Threads business information and their relationships.
- **Security Layer:** Roles, profiles, permission sets, sharing rules, and field-level security control access to customer, product, order, inventory, and business information based on user responsibilities.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The HandsMen Threads Fashion Retail Management System follows the Agile methodology, organizing work into epics, user stories, and story points. Development is carried out in sprints, with progress reviewed regularly to plan the next stage.

Product backlog and sprint schedule

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Developer Setup	USN-1	As a system administrator, I want to create and configure the Salesforce developer environment so that I can develop and test the HandsMen Threads Fashion Retail Management System.	1	High	Member1
Sprint-1	Data Management	USN-2	As an admin, I want to create custom objects for Customer, Product, Inventory, Order, and Loyalty & Marketing so that HandsMen Threads business data can be stored and managed efficiently.	5	High	Member2
Sprint-2	Data Management	USN-3	As a user, I want dedicated tabs for customers, products, inventory, orders, and loyalty/marketing records so that I can easily navigate between business records.	3	High	Member3
Sprint-2	Data Management	USN-4	As an admin, I want to create relevant fields for customers, products, inventory, orders, and	5	High	Member4

			loyalty information so that complete and accurate fashion retail information can be captured.			
Sprint-2	Data Management	USN-5	As an admin, I want to define relationships between customers, products, inventory, and orders so that related fashion retail activities can be tracked efficiently.	5	High	Member1
Sprint-2	App Management	USN-6	As a user, I want a centralized HandsMen Threads Lightning App so that I can access customer, product, order, inventory, and business operations from one interface.	3	High	Member4
Sprint-3	Process Automation	USN-7	As a system, I want validation rules for customer, product, inventory, and order information so that incorrect or incomplete records are prevented.	3	High	Member2

Sprint-3	Process Automation	USN-8	As a system, I want automated flows to process orders, update order statuses, identify low-stock products, and send notifications so that manual processing effort is reduced.	5	High	Member4
Sprint-3	Process Automation	USN-9	As a manager, I want an approval process for applicable customer orders so that orders are reviewed before further processing.	5	High	Member1
Sprint-4	Apex Development	USN-10	As a system, I want Apex classes and triggers to handle complex order and inventory operations so that HandsMen Threads business rules can be processed automatically.	5	High	Member3
Sprint-5	Security	USN-11	As an administrator, I want role-based security and permissions so that users can access only the customer, product, order, inventory, and business information relevant to their responsibilities.	5	High	Member2

Sprint-6	Reports & Dashboards	USN-13	As a manager, I want reports and dashboards showing order trends, inventory levels, low-stock products, customer information, and order status so that I can monitor HandsMen Threads business performance and make informed decisions.	4	High	Member4

Epic Summary

Epic	Stories	Story Points
Developer Setup	USN-1	1
Data Management	USN-2 to USN-6	21
Process Automation	USN-7 to USN-9	13
Security	USN-11	5
Batch & Scheduled Processes	USN-12	5

6. PROJECT DEVELOPMENT PHASE

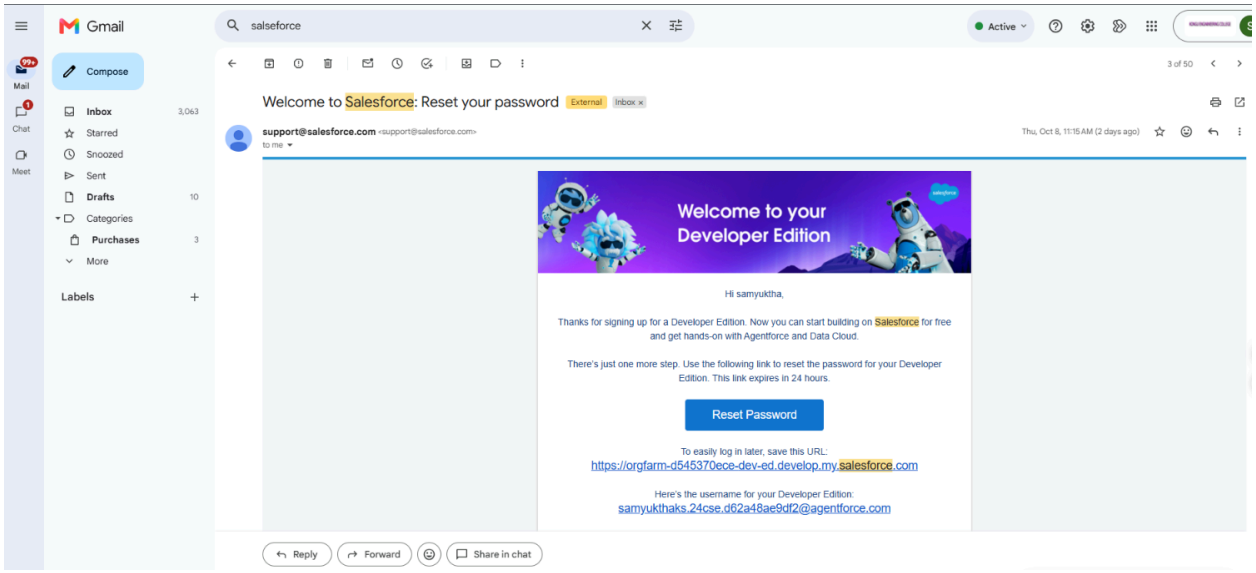

Milestone 1: Salesforce Developer Account Creation

Definition: A free Salesforce Developer Edition org is the working environment where the complete HandsMen Threads Fashion Retail Management System is built, tested, and demonstrated. It provides the Salesforce platform required for developing the fashion retail solution without affecting any production system.

Key steps:

- Sign up at developer.salesforce.com/signup
- Verify the email and set a password
- Log in and open Setup

Milestone 2: Custom Object Creation

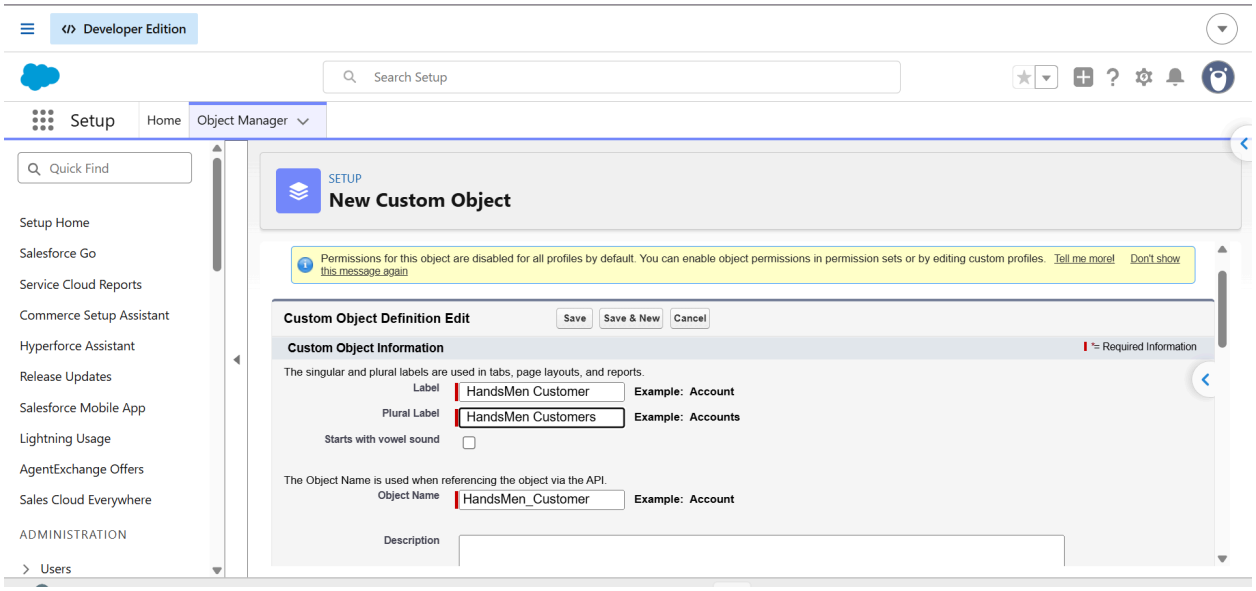

Definition: A custom object is a database table in Salesforce. The HandsMen Threads system uses custom objects to store core fashion retail information such as customers, products, inventory, orders, and loyalty/marketing activities.

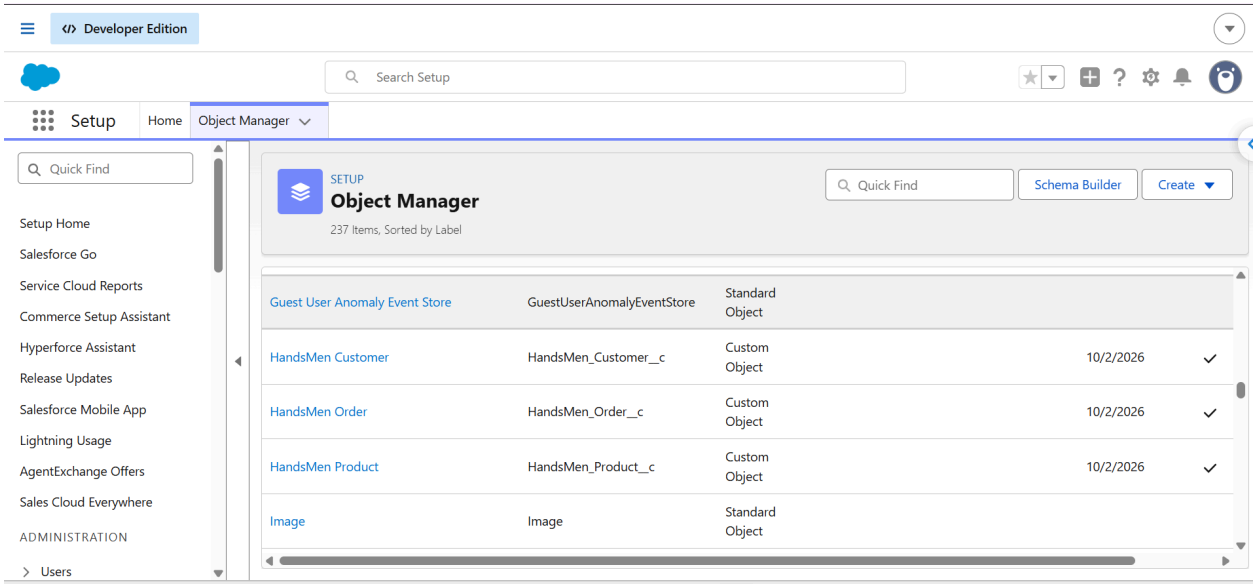

Objects:

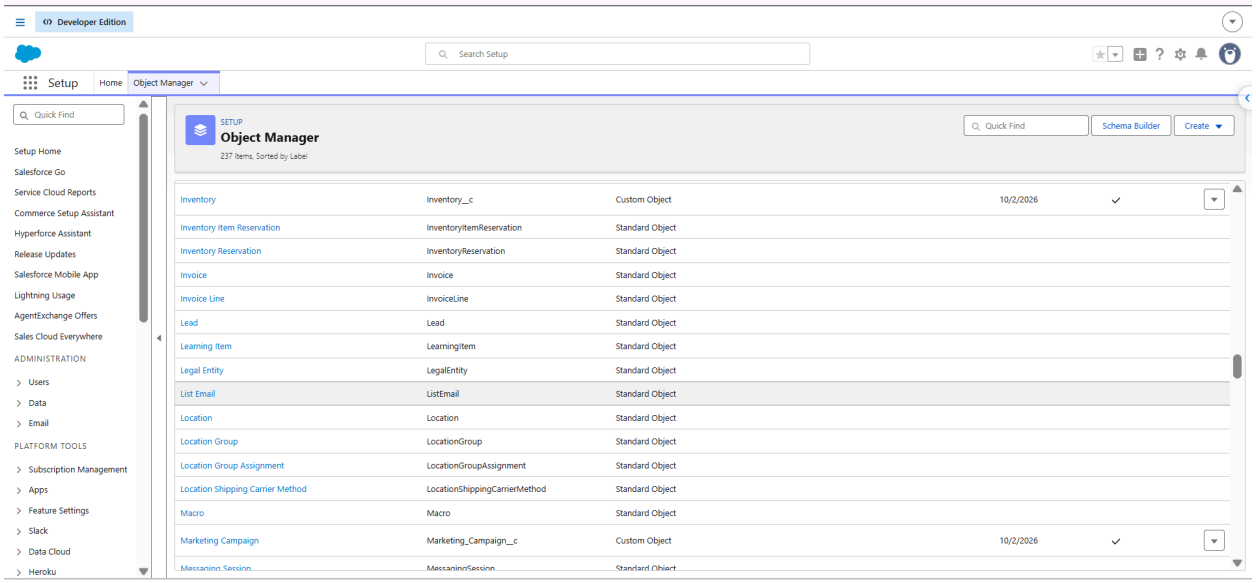

- **Object – HandsMen Customer:** Stores customer details such as name, contact information, preferences, and other customer-related information.
- **Object – HandsMen Product:** Stores men's fashion product details such as product name, category, size, price, and availability.
- **Object – HandsMen Order:** Stores customer order information, including customer, products, quantities, order status, and related order details.
- **Object – Inventory:** Stores product stock information such as available quantity and reorder level to help monitor product availability and low-stock products.
- **Object – Marketing Campaign:** Stores marketing campaign information used to manage promotional activities and customer engagement.

Key steps:

- Setup > Object Manager > Create > Custom Object.
- Create the required custom objects.
- Enter the object label, plural label, and record name.
- Enable **Allow Reports** and **Allow Search**.
- Create custom tabs for the objects where required.

Milestone 3: Tabs Creation

Definition The HandsMen Customer tab provides direct access to customer records in the HandsMen Threads Fashion Retail Management System. It allows authorized users to create, view, and manage customer information efficiently.

Create Tabs

- Setup > Tabs > Custom Object Tabs > New
- Select the HandsMen Customer object.
- Choose an appropriate Tab Style.
- Enter the tab description if required.
- Set the required Tab Visibility for user profiles.
- Save the tab.
- Add the HandsMen Customer tab to the HandsMen Threads Lightning App

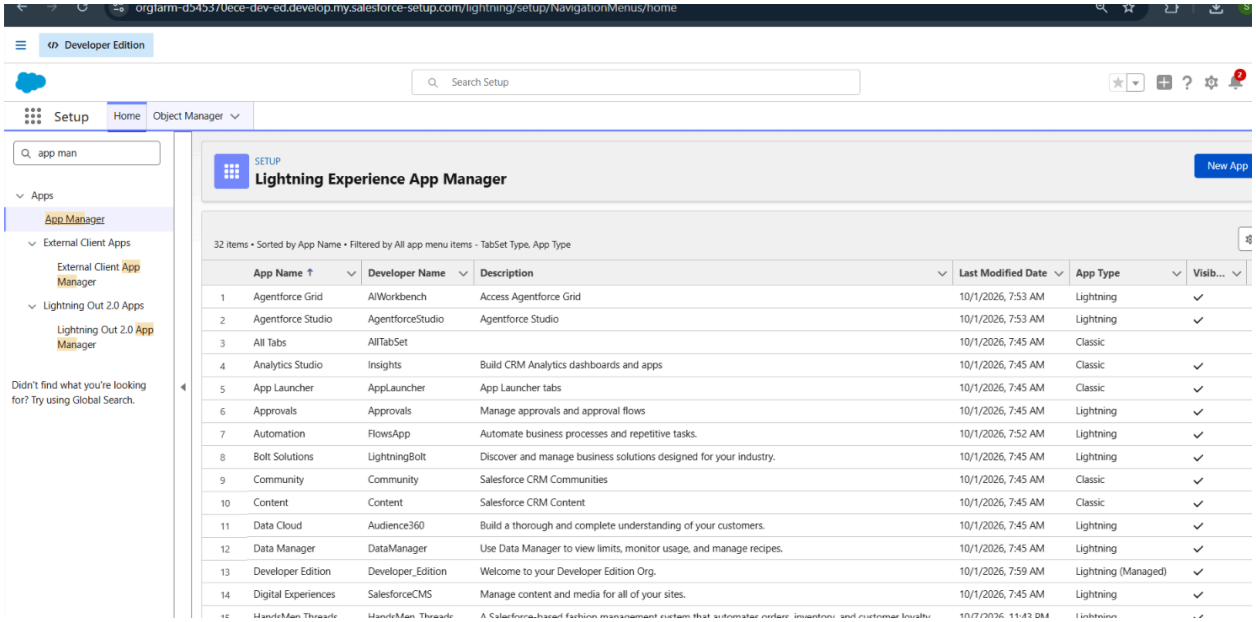

Milestone 4: Lightning App Creation

Definition: The HandsMen Threads Lightning App provides a centralized workspace for managing the fashion retail operations of HandsMen Threads. It brings customer, product, order, inventory, and marketing information together in one interface.

Key Steps:

- Setup > App Manager > New Lightning App.
- Enter the app name as HandsMen Threads.
- Configure the app branding and navigation style.
- Add the required tabs such as HandsMen Customer, HandsMen Product, HandsMen Order, Inventory, and Marketing Campaign.
- Add Reports and Dashboards to the navigation.
- Set the required user profiles and app visibility.
- Save and test the HandsMen Threads Lightning App.

Milestone 5: Fields Creation

Definition: The HandsMen Threads system uses fields to capture and manage customer, product, order, inventory, and marketing information accurately.

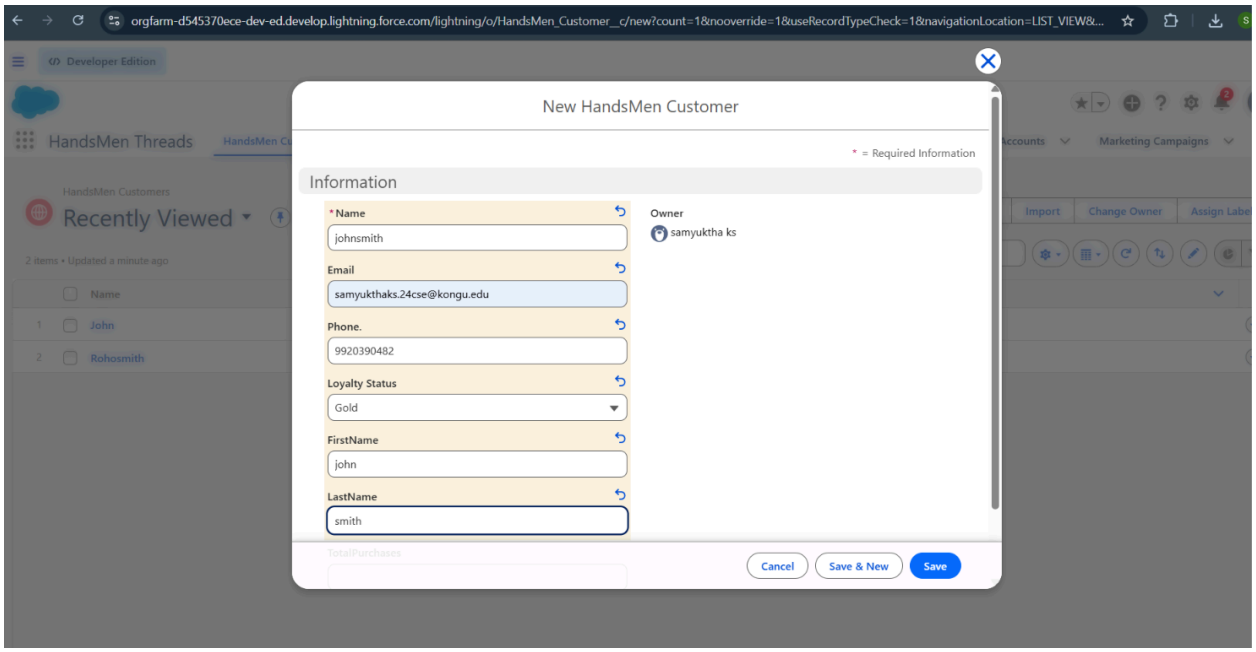

Key fields:

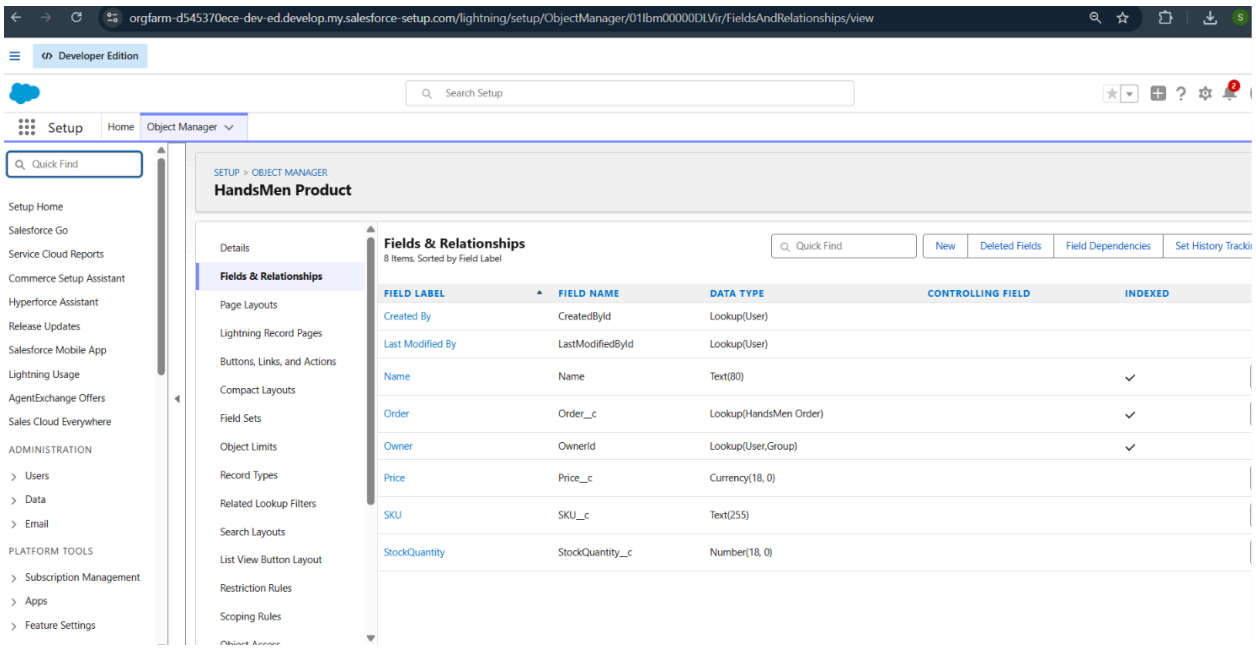

- **Field – Email:** Stores the customer's email address for communication and notifications.
- **Field – Phone:** Stores the customer's contact number.
- **Field – Loyalty Status:** Stores the current loyalty status of the customer, such as eligible or active loyalty membership.
- **Create Lookup Relationship:** Creates relationships between related objects, such as linking HandsMen Order with HandsMen Customer and HandsMen Product, so related retail information can be accessed from connected records.
- **Formula Fields:** Automatically calculates values from existing fields, such as order totals, available stock status, or other derived business information.
- **Create Remaining Fields for the Object:** Create the remaining required fields for HandsMen Customer, HandsMen Product, HandsMen Order, Inventory, and Marketing Campaign objects based on the project requirements.

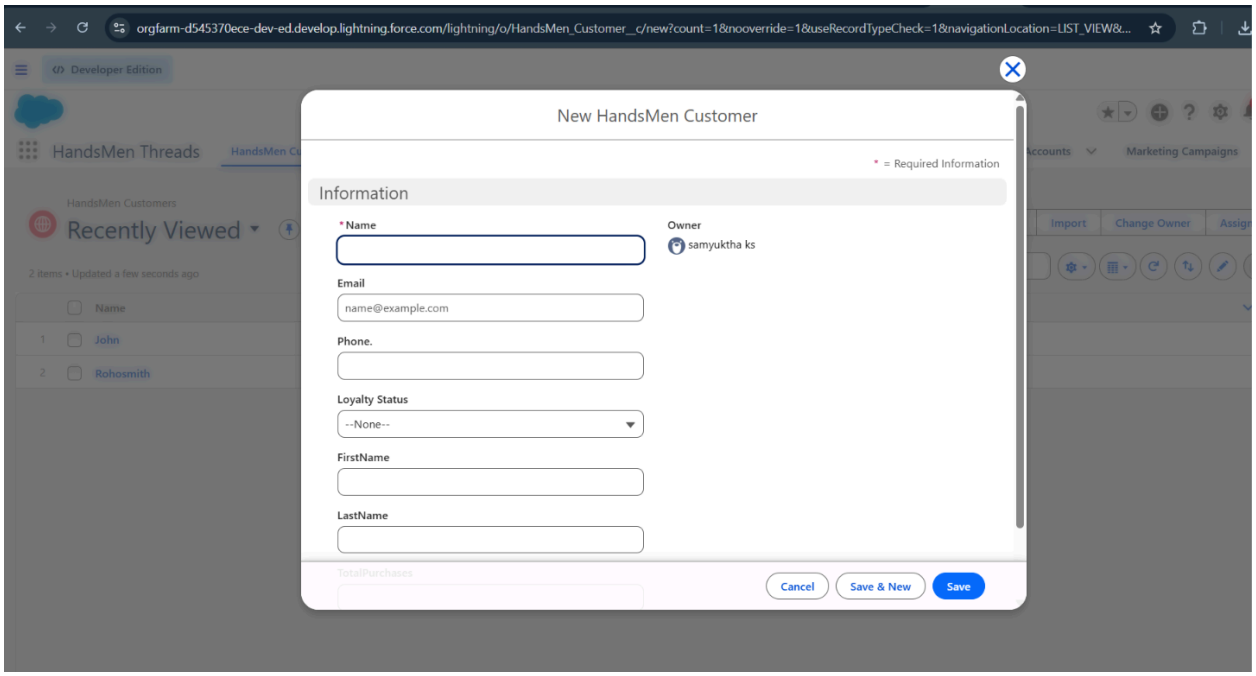

Key Steps:

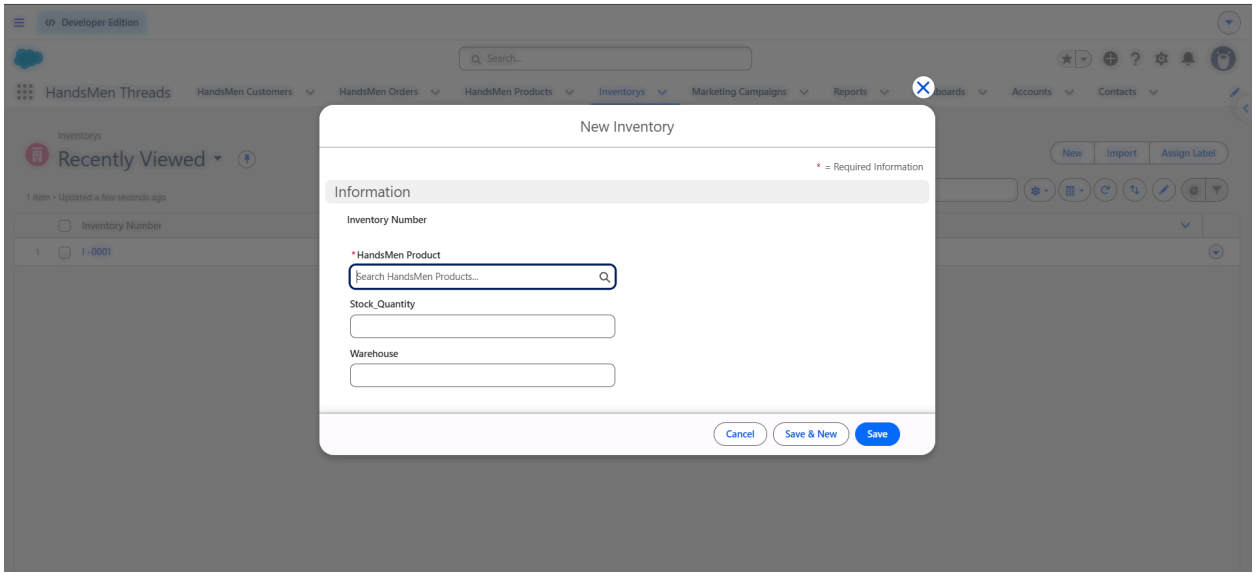

- Object Manager > Select the required object > Fields & Relationships > New.
- Select the appropriate field type.
- Enter the field label and field name.

- Configure required values and field-level security.
- Create Lookup Relationship fields where required.
- Create Formula fields with the required formula.
- Add the fields to the appropriate page layouts.
- Save and test the fields using sample HandsMen Threads records.

Milestone 6: Data Management – Field Creation & Field Types

Definition: Validation Rules ensure that the data entered into the HandsMen Threads Salesforce system is accurate and follows the required business conditions. They prevent users from saving records when the entered information does not meet the defined criteria.

Key steps:

• Go to Setup > Object Manager > Select Object > Validation Rules > New.

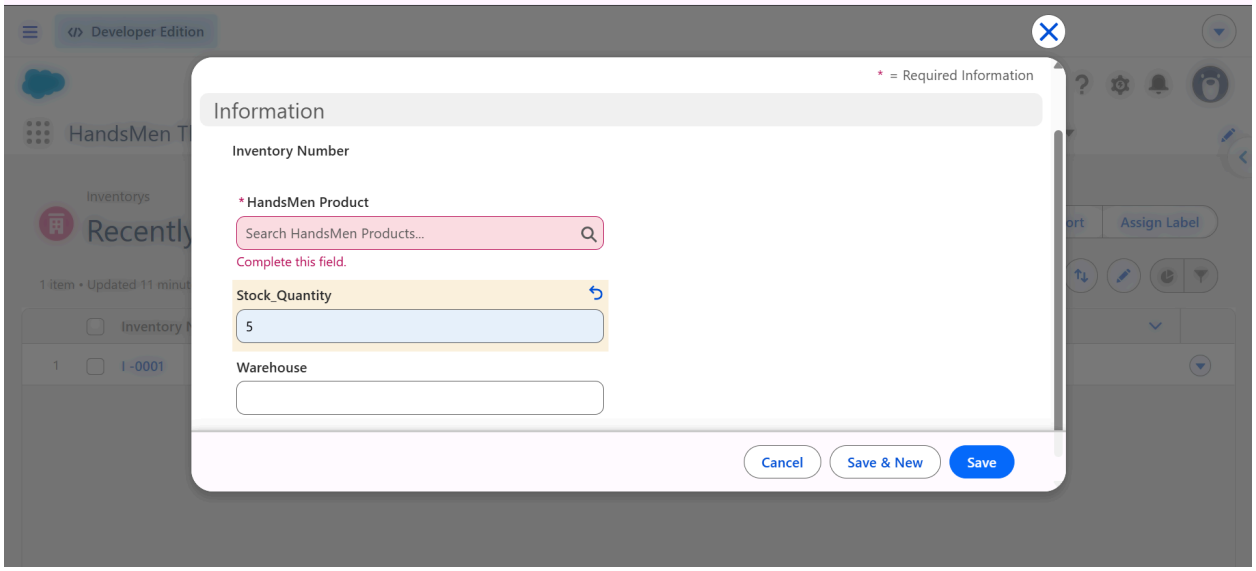

• Enter the Rule Name and define the validation condition using a Salesforce formula.

• Configure validation rules for important HandsMen Threads objects such as Product, Order, Customer, and Inventory.

• Create the remaining validation rules to ensure valid values for fields such as Order Quantity, Product Price, Stock Quantity, Payment Status, and Order Status.

• Enter a clear Error Message and select the field or page location where the error should be displayed.

• Click Save and test each validation rule by entering invalid data and verifying that the appropriate error message is displayed.

Milestone 7: Data Security – Roles

Definition: Roles control the level of record access for different users in the HandsMen Threads system. They help ensure that users can access the customer, product, order, inventory, payment, and delivery records required for their responsibilities.

Key steps:

• Go to **Setup > Roles > Set Up Roles**.

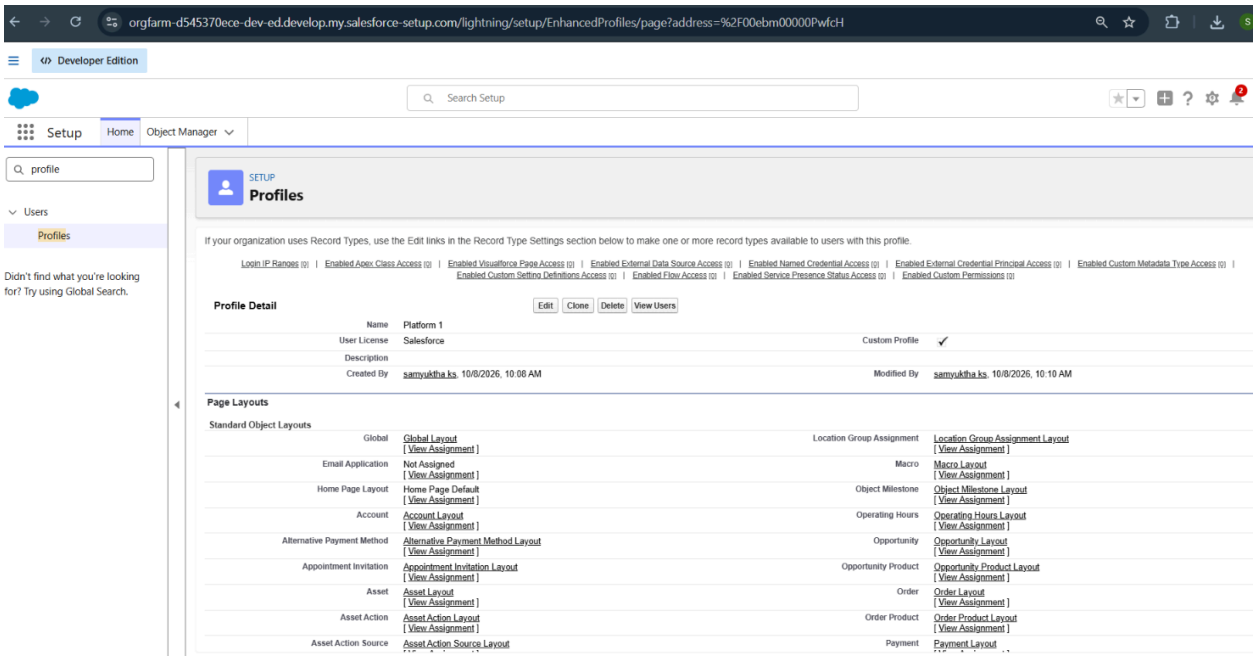

• Create roles such as **Sales, Warehouse Manager, and Finance Team**.

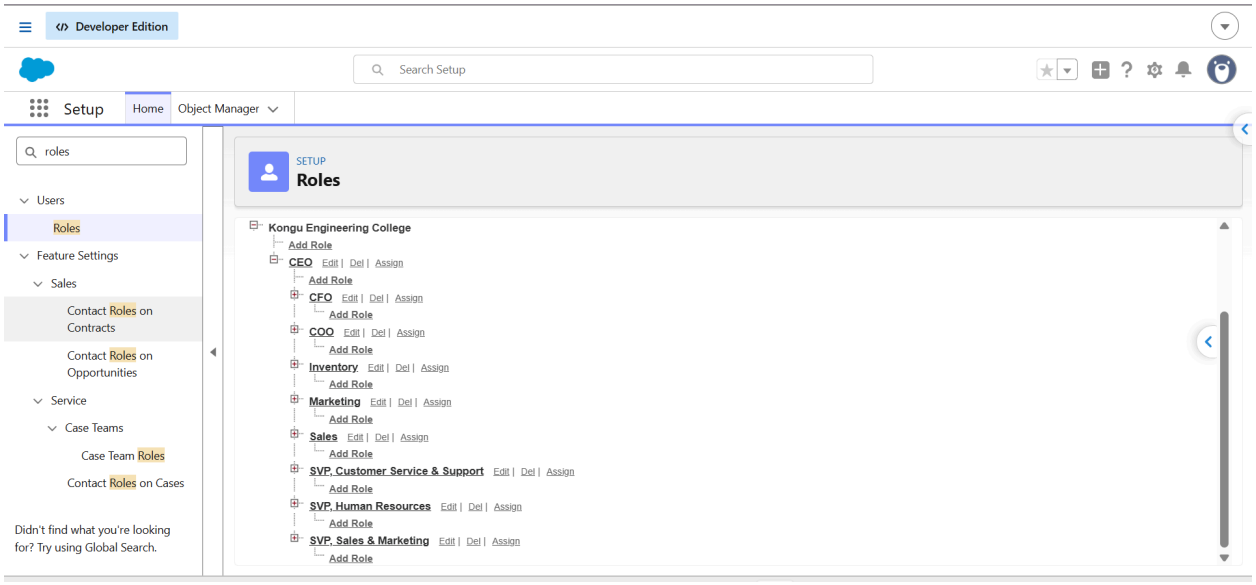

• Arrange the roles in the **Role Hierarchy** according to their responsibilities.

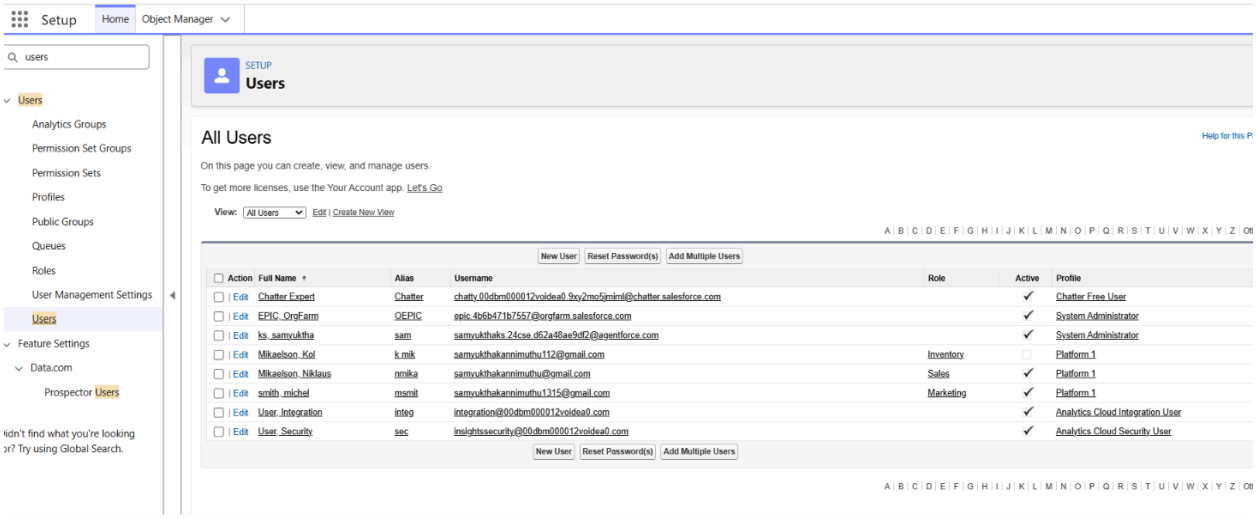

• Assign users such as **Niklaus and Kol** to their appropriate roles.

• Configure **Organization-Wide Defaults and Sharing Rules** to control record visibility.

• Test the access levels to ensure users can view and manage only the HandsMen Threads records permitted for their roles.

Milestone 8: Email Templates

Definition: Email Templates in the HandsMen Threads system are used to send standardized and automated emails for important business activities such as order confirmation, payment updates, and delivery notifications.

Key steps:

• Go to Setup > Email Templates.

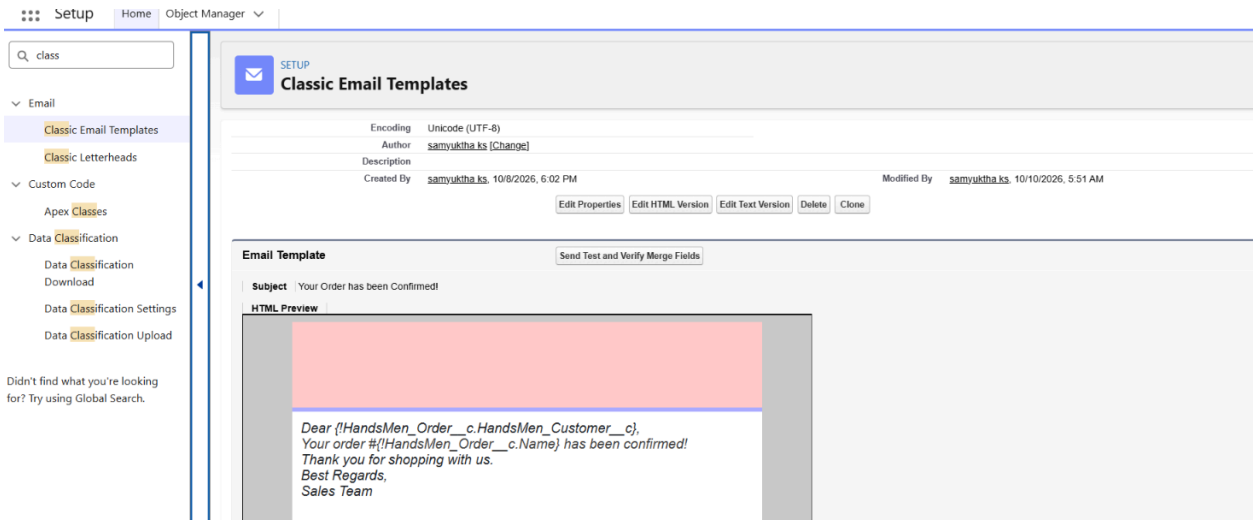

• Create an Order Confirmation Email Template with the required order and customer details.

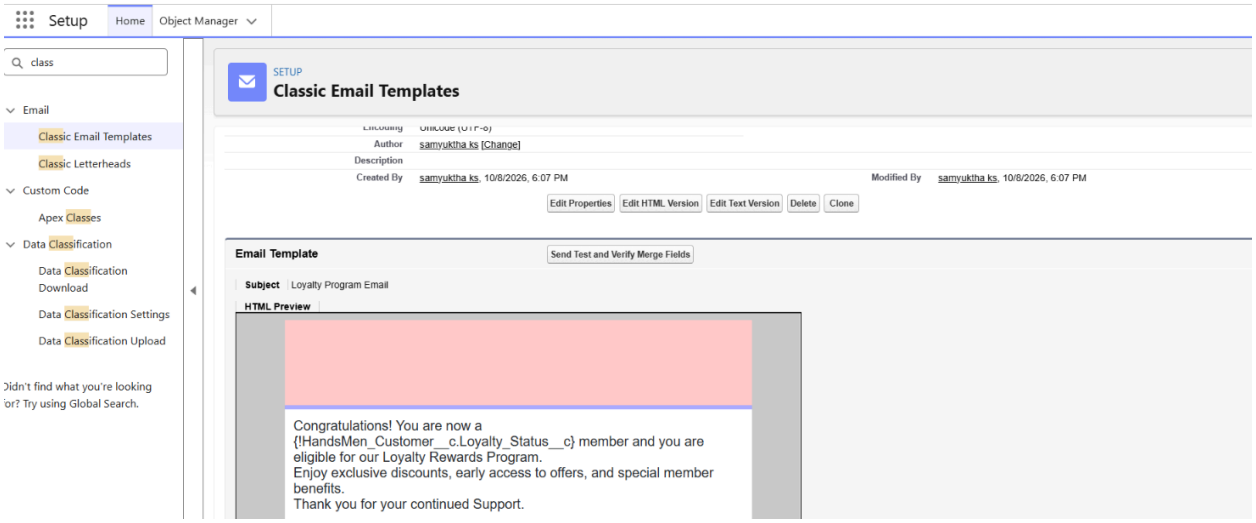

• Create the remaining email templates for Payment Confirmation, Order Cancellation, and Delivery Updates.

• Add appropriate merge fields to display dynamic information such as customer name, order number, product, quantity, and order status.

• Configure suitable email subjects and message content for each template.

• Save and test the email templates using sample HandsMen Threads records.

Milestone 9: Email Alert

Definition: Email Alerts are used to automatically send email notifications when specific business conditions or Salesforce automation processes are triggered.

Key steps:

• Go to **Setup > Email Alerts > New Email Alert**.

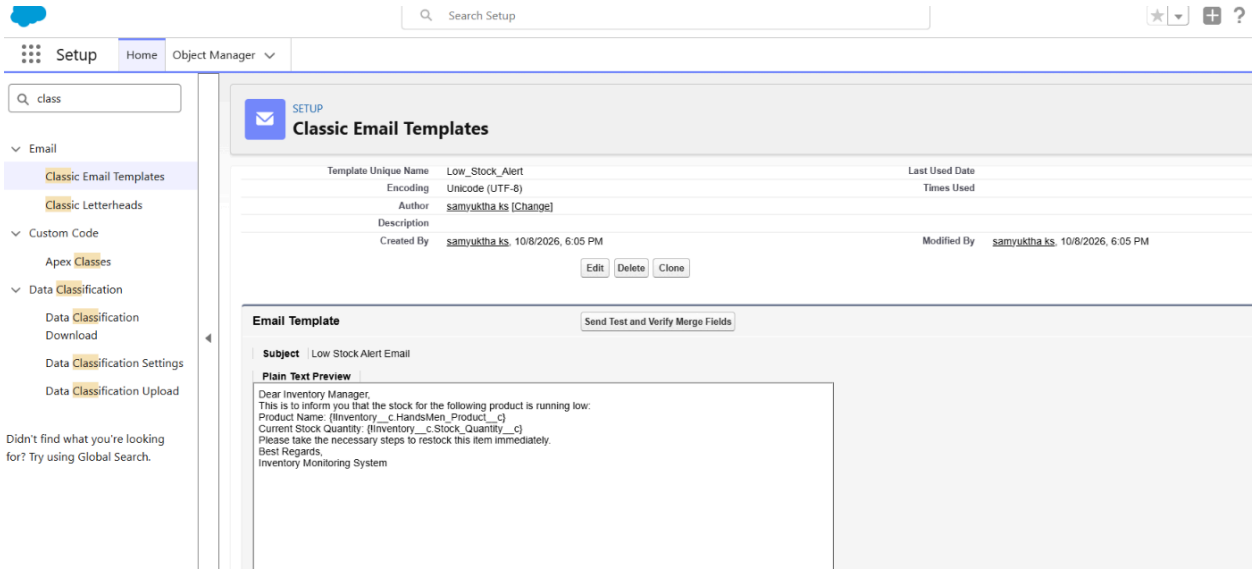

• Select the required **HandsMen Threads object**.

• Select the appropriate **Email Template**.

• Add the required recipients such as **record owner, Sales users, or Finance Team**.

• Configure the email alert to be triggered through the required automation process.

• Save and test the email alert using sample HandsMen Threads records.

Milestone 10: FLOWS

Definition: Flows in the HandsMen Threads system automate business processes such as order confirmation, stock monitoring, and scheduled notifications. They reduce manual work and ensure that important actions are performed automatically.

Key steps:

• Go to Setup > Flows > New Flow.

• Create an Order Confirmation Email Flow to automatically send an email when an order is confirmed.

• Select the required HandsMen Order object and configure the appropriate record-triggered conditions.

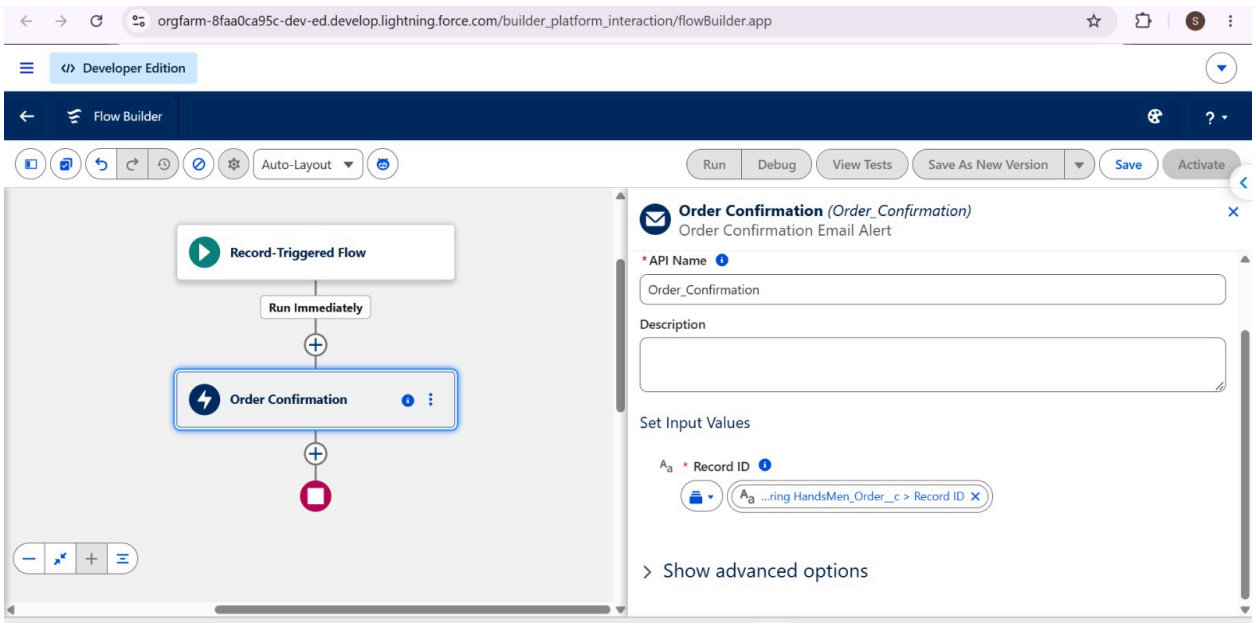

• Create a Stock Alert Email Flow using a Record-Triggered Flow to send an alert when product stock falls below the required level.

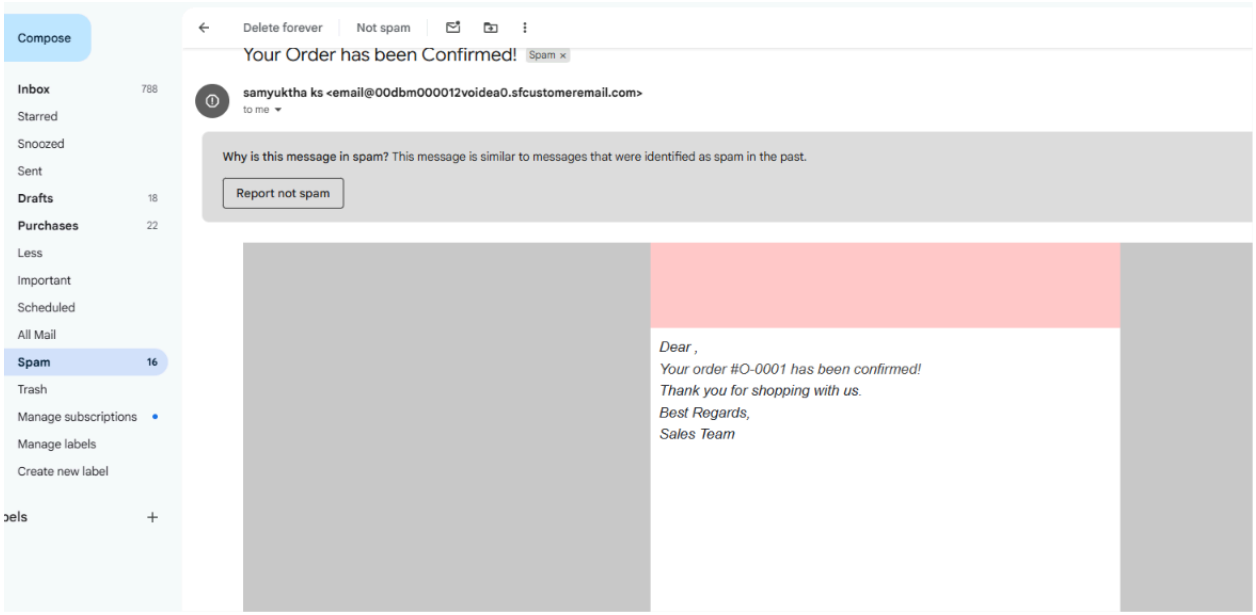

• Configure the stock condition and select the appropriate Email Alert or Email Template.

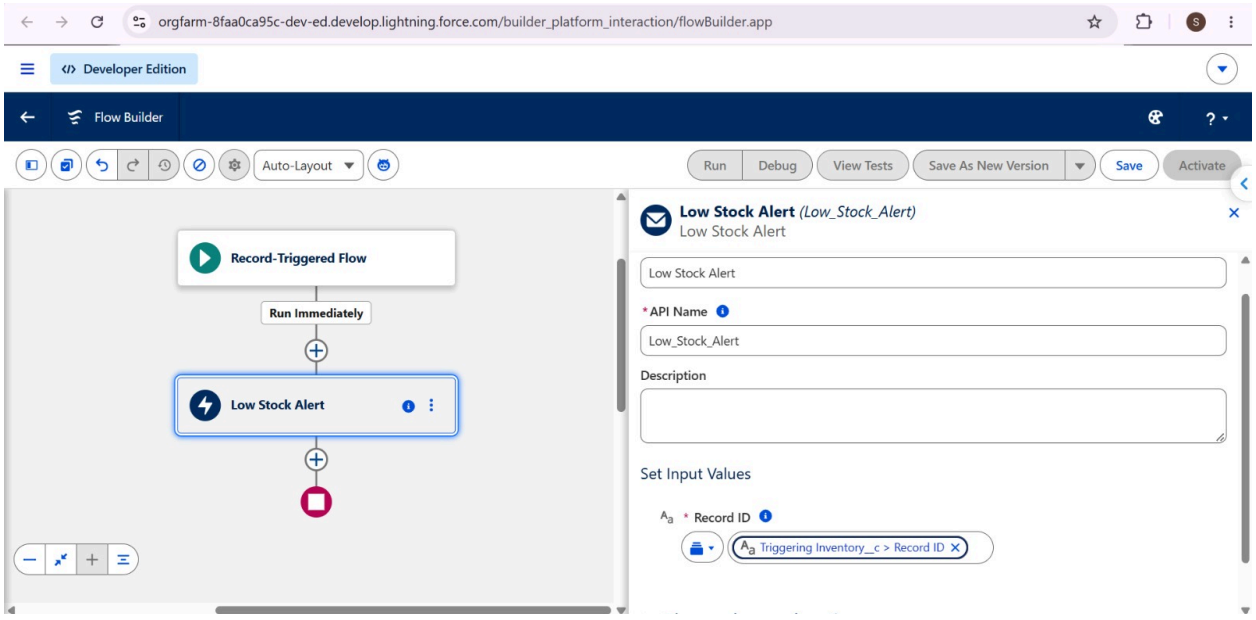

• Create a Scheduled Flow to perform regular tasks such as checking stock levels and sending scheduled notifications.

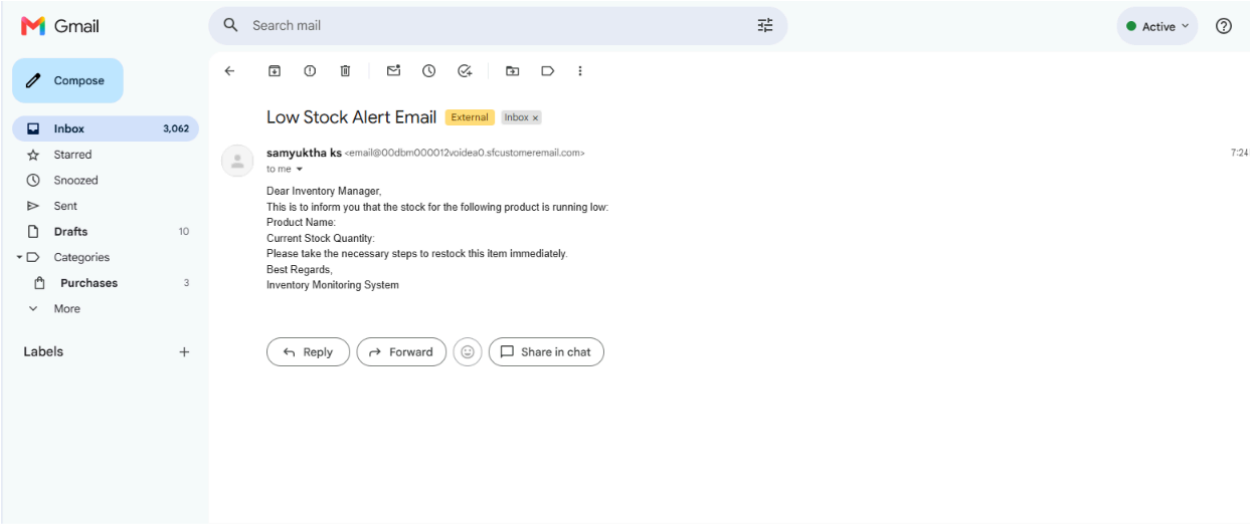

• Configure the schedule, entry conditions, actions, and email notifications.

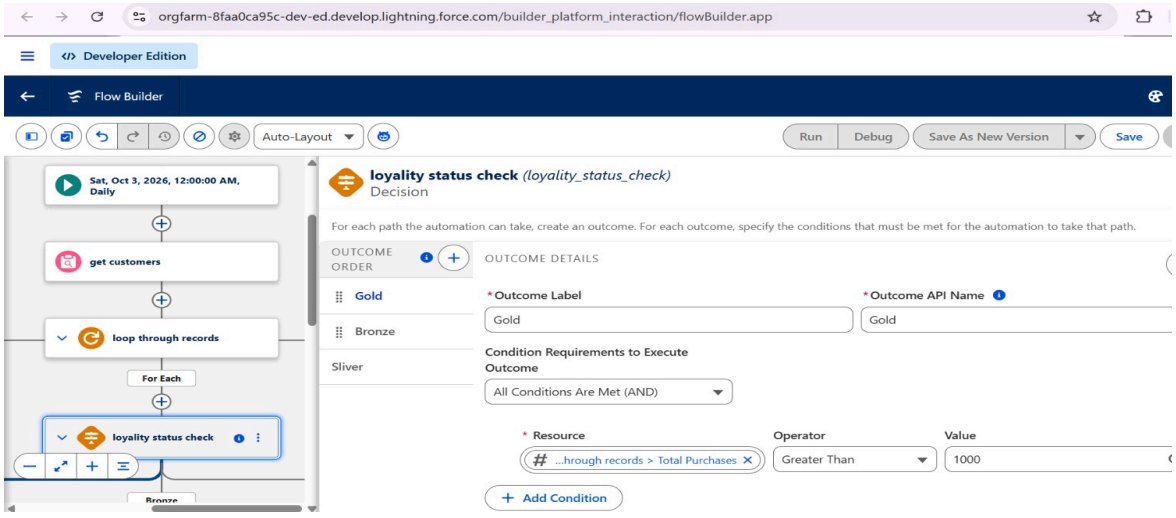

• Save, activate, and test all flows using sample HandsMen Threads records.

Milestone 11: Apex Class

Definition: Apex Classes in the HandsMen Threads system are used to implement custom business logic that cannot be handled easily using standard Salesforce configuration and Flow features.

Key steps:

• Go to Setup > Apex Classes > New.

• Enter the Apex Class Name and define the required business logic.

• Create methods to perform required operations such as order processing, stock management, and data validation.

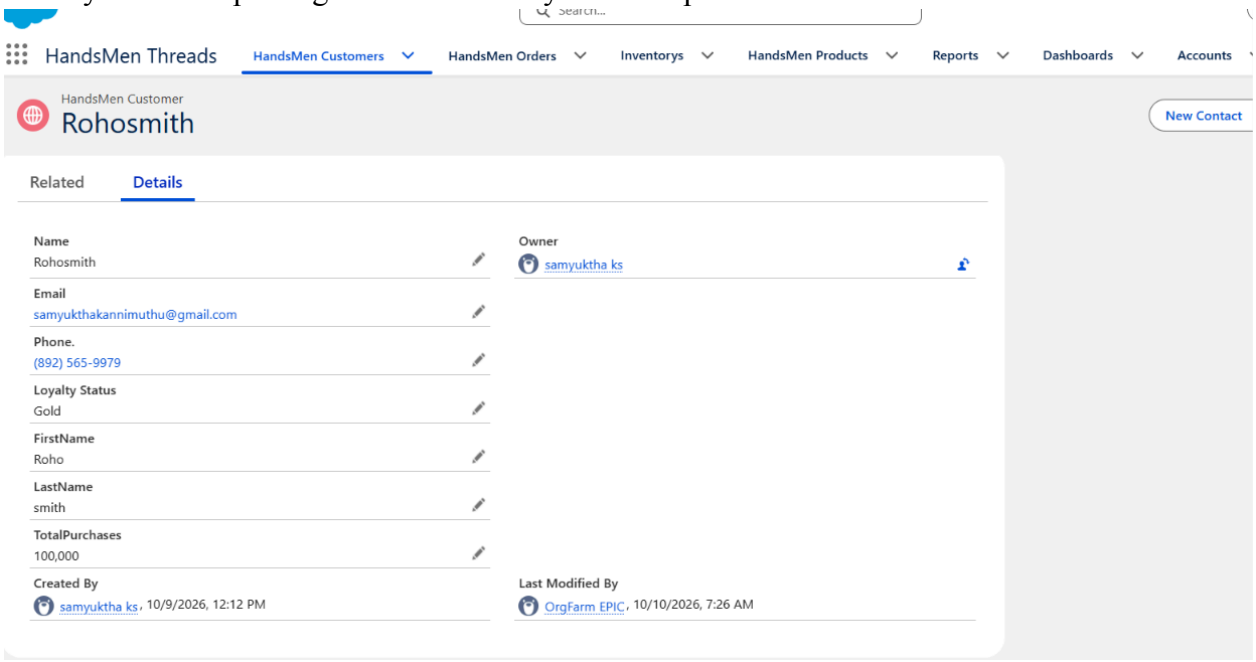

• Use Salesforce Objects, Fields, SOQL, and DML operations as required.

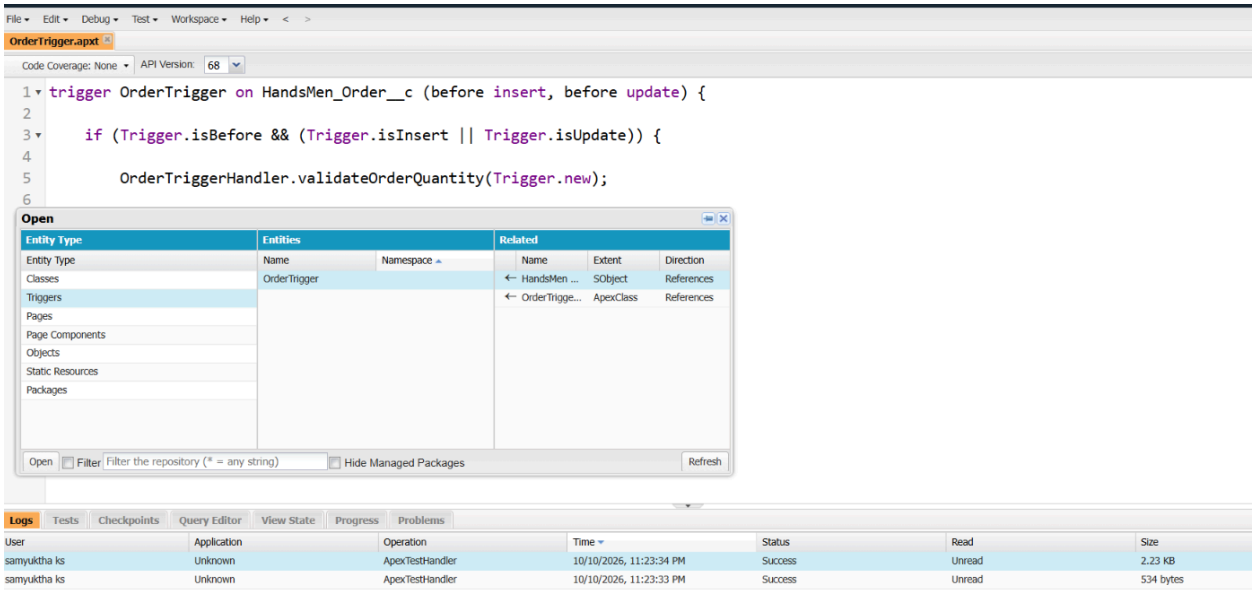

• Add appropriate error handling and ensure the class follows Salesforce coding standards.

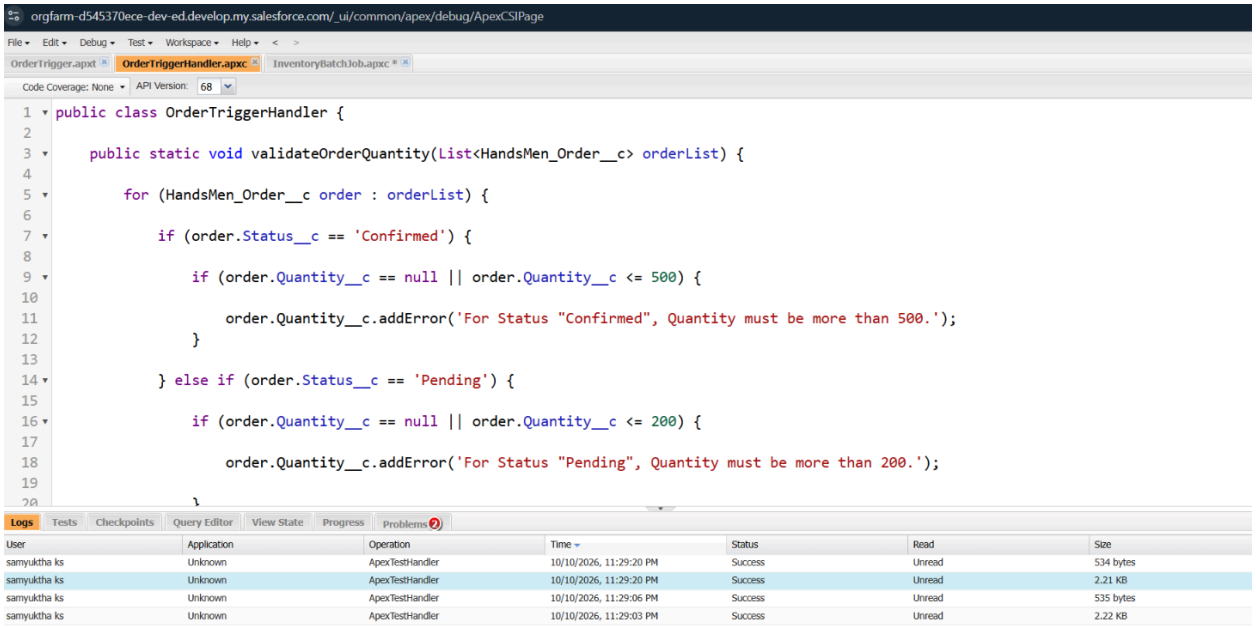

• Save and compile the Apex Class successfully.

• Test the Apex Class using Execute Anonymous or an appropriate test class.

• Verify that the Apex logic works correctly with sample HandsMen Threads records.

Milestone 12: Batch Jobs – Create Batch Apex

Definition:
Batch Apex in the HandsMen Threads system is used to process a large number of records efficiently in smaller batches. It can be used for bulk operations such as updating inventory, processing orders, or maintaining product records.

Key steps:

• Go to Setup > Apex Classes > New.

• Create a Batch Apex Class that implements the Database.Batchable interface.

• Define the start, execute, and finish methods for processing HandsMen Threads records.

• Use SOQL in the start method to retrieve the required records.

• Implement the required business logic in the execute method to process records in batches.

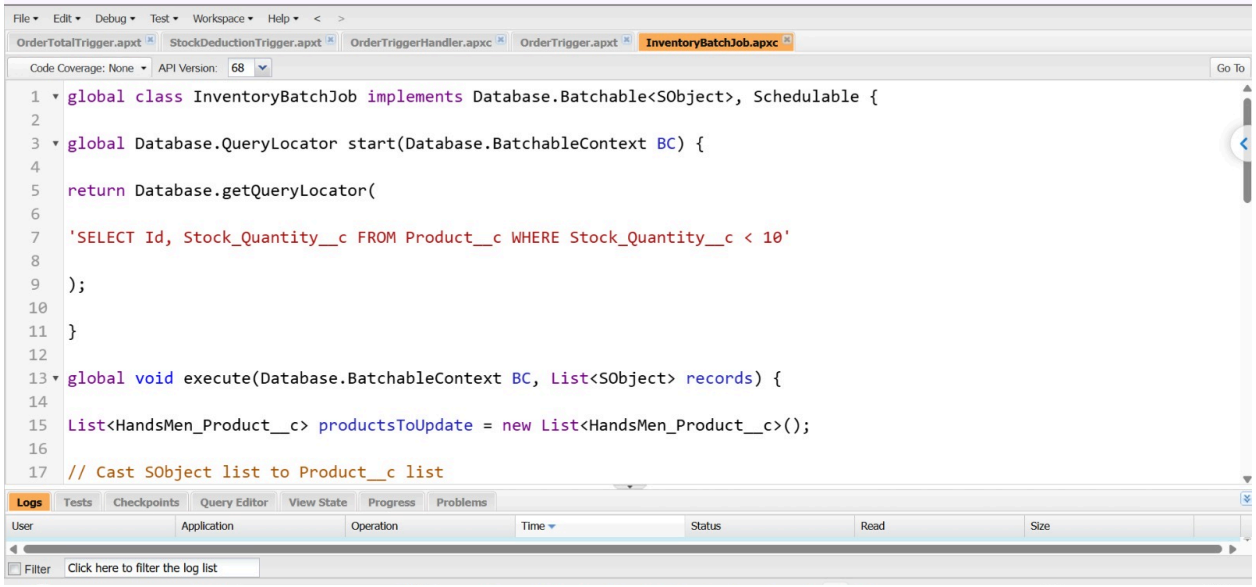

• Use the finish method to perform completion actions such as sending a notification.

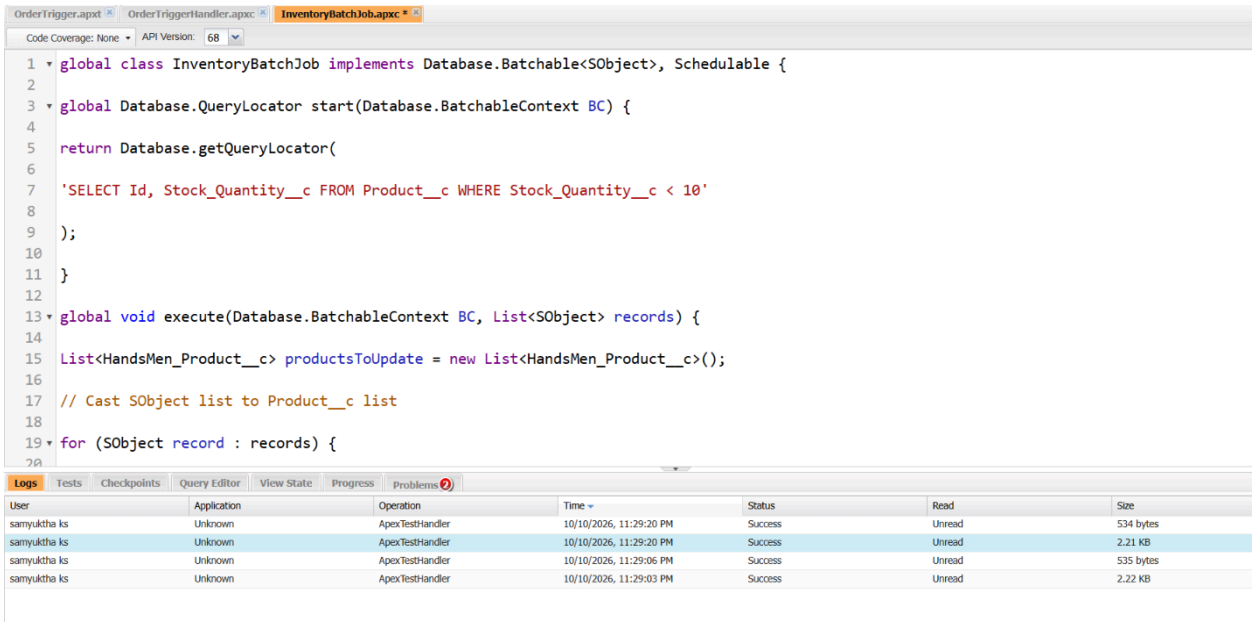

• Save and compile the Batch Apex class successfully.

• Execute the Batch Apex job using Execute Anonymous.

• Monitor the batch job from Setup > Apex Jobs.

• Test the batch process using sample HandsMen Threads records.

Milestone 13: Conclusion

Project Summary

The **HandsMen Threads Order Management System** replaces manual order handling, inventory tracking, and disconnected customer service processes with a centralized Salesforce-based system. It brings order processing, product and inventory management, customer information, automation, security, email notifications, and reporting together so that the organization can manage its clothing business efficiently from one platform.

Outcomes and Benefits

• **Efficiency:** Reduces manual order entry and automates repetitive order-processing activities.

• **Accuracy:** Validation rules and automated updates reduce incorrect order, product, and inventory records.

• **Speed:** Automated order status updates, stock alerts, and email notifications help process orders faster.

• **Transparency:** Users can view current customer, product, order, and inventory information without depending on manual updates.

• **Customer Service:** Sales and customer service staff can quickly access order details and respond to customer queries effectively.

• **Security:** Profiles, roles, permission sets, and sharing settings provide controlled access to HandsMen Threads data.

• **Scalability and Maintainability:** The system can support additional products, customers, orders, and users as the business grows.

Possible Future Enhancements

• **Online customer portal** for customers to place orders, track order status, and view order history.

• **Automated inventory alerts** to notify staff when product stock reaches the reorder level.

• **Mobile access** for sales and warehouse staff to manage orders and inventory while working outside the office.

• **Advanced analytics** for identifying sales trends, product demand, inventory movement, and business performance.

• **Payment integration** for faster and more convenient order payments.

• **Logistics integration** to track deliveries and provide customers with shipment updates.

• **AI-assisted features** such as demand forecasting, inventory prediction, customer support, and intelligent product recommendations.

Closing Statement

The **HandsMen Threads Order Management System** achieves its core objectives by providing centralized order processing, accurate inventory tracking, automated workflows, secure data access, email notifications, and real-time reporting. The Salesforce-based system provides a strong foundation for improving clothing business operations, reducing manual work, and delivering better customer service.
